

WEB DEVELOPMENT PROJECT REPORT

NOVA BADZLINA GLOBAL

*A bilingual creator portfolio and booking platform
built entirely in HTML and CSS*

NAME	NUR BADZLINA RAZI BINTI MOHAMED GAZALI known professionally as Ara Aranya
MATRIC NUMBER	MC251139118
PROJECT	Nova Badzlina Global
TECHNOLOGY	HTML5 and CSS3 only — no JavaScript, frameworks or libraries
DELIVERABLE	18 web pages · 6 printable business documents · 2 languages
YEAR	2026

1 Introduction

1.1 Background

Nova Badzlina Global is the working identity of a Malaysian content creator operating across user-generated content (UGC), influencer marketing, video production, photography and voice-over work. The business serves brands who need social-media content produced quickly and delivered ready to publish.

1.2 Problem statement

Before this project, every client enquiry began from nothing. The same questions were answered repeatedly — what services are offered, what they cost, what is included, when payment is due, and what the client receives at the end. This consumed time, produced inconsistent answers, and occasionally led to disagreements after work had already begun because terms had never been written down.

A secondary problem was reach. A significant share of potential clients are more comfortable reading Bahasa Melayu than English, and an English-only site risked losing them at first contact.

1.3 Objectives

1. Present the portfolio across three media types — video, photography and audio.
2. State services, pricing structure and terms clearly enough to remove ambiguity.
3. Capture a complete project brief in a single submission.
4. Serve English and Bahasa Melayu speakers equally.
5. Provide printable contract, invoice and receipt documents.
6. Achieve all of the above using **only HTML and CSS**.

1.4 Scope

The project delivers eighteen web pages — nine in English and nine mirrored in Bahasa Melayu — together with six printable business documents. It is a static site: it requires no server-side processing, no database and no runtime scripting.

2 Target audience

The site addresses three distinct visitors, each needing something different:

VISITOR	WHAT THEY NEED	HOW THE SITE SERVES THEM
Brand marketing manager	Proof of quality, clear pricing, professional terms	Portfolio pages, rates table, usage-rights and cancellation clauses
Small business owner	Plain explanation, low friction, reassurance	Bahasa Melayu pages, WhatsApp contact, plain-language terms
Agency producer	Technical specifications, availability, formats	Video length ranges, export ratios, delivery methods, in-person availability

3 Tools and technology

COMPONENT	CHOICE	REASON
Markup	HTML5	Semantic elements improve accessibility and search indexing
Styling	CSS3, single stylesheet	One file controls all 18 pages; a change propagates everywhere
Scripting	None	Project requirement, adopted as a design discipline
Typography	System font stack	No external font requests; nothing to fail or slow the page
Icons	Unicode and emoji	No icon library or image sprites required
Media	Native <code><audio></code> and <code><video></code>	Built-in browser controls; no player library
Favicon	Inline SVG data URI	No separate image file needed

The project has **zero external dependencies**. Every asset is either written by hand or owned by the business. This means the site cannot break because a third-party service changed, expired or went offline.

4 Site structure

Pages fall into three functional groups.

4.1 Public-facing pages

- ✦ **Home** — hero, reasons to hire, twelve services, four UGC specialisms, portfolio carousel, rates and terms, social accounts, about section
- ✦ **Voice Demos** — twenty-two audio tracks organised into ten read styles across two languages
- ✦ **Work** — twenty video slots and twelve photography slots, grouped by category
- ✦ **Contact** — four direct channels with guidance on which to use

4.2 Transaction pages

- ✦ **Book Me** — a thirty-two field brief form, preceded by terms at a glance and followed by usage rights, revision policy, cancellation terms and client obligations
- ✦ **Payment** — five payment methods as tabbed panels, four billing patterns, availability and travel surcharges, delivery process

4.3 Printable documents

- ✦ **Booking Agreement** — thirteen clauses with two-party signature blocks
- ✦ **Invoice** — line items, totals, payment instructions with embedded QR code
- ✦ **Receipt** — paid confirmation with balance tracking

Navigation principle. A visitor should never be more than two clicks from booking. The primary call to action appears in the navigation bar of every page, and a floating WhatsApp button remains visible while scrolling.

5.1 Visual identity

The design brief called for a site that felt *elegant, dreamy, feminine, sparkling and gold*, while remaining credible enough to close commercial deals. These pull in opposite directions: softness suggests approachability, structure suggests authority. The resolution — named **Celestial Atelier** — keeps the atmosphere soft but the structure disciplined.

5.2 Colour

A light cream and dusty-rose base carries the dreamy quality, since cloud and light effects require a pale ground. Deep aubergine bands alternate with the light sections to create rhythm and contrast down the page. Gold functions as the metal throughout — it reads as expensive against the dark bands in a way it cannot against cream.

ROLE	VALUE	USE
Ink	#0d1435	Headings and body text
Rose	#c2447a	Accents, focus states, calls to action
Gold	#bf8f2c	Rules, ornament, primary buttons
Dusty rose	#c88a72	Background warmth
Deep band	#0b1233	Alternating sections

5.3 Typography

Headings use a high-contrast serif stack (Didot, Bodoni MT, Playfair Display, with Georgia as fallback). The thick-to-thin stroke contrast conveys elegance and authority simultaneously. Body text uses a clean sans-serif for readability. This split is deliberate: dramatic headline paired with plain paragraph prevents the design from becoming decorative at the expense of legibility.

5.4 Layout and responsiveness

Layout uses CSS Grid with `auto-fit` and `minmax()`, so columns reflow according to available width without media queries for every breakpoint. Two breakpoints handle structural changes: at 900 pixels the carousel stacks vertically and the about section becomes a single column; at 640 pixels navigation centres and the floating button reduces to its icon.

```
/* columns adapt without fixed breakpoints */
.cards {
  display: grid;
  grid-template-columns: repeat(auto-fit, minmax(280px, 1fr));
  gap: 1.6rem;
}
```

6.1 The no-JavaScript constraint

Several features conventionally require scripting: an image carousel, tabbed panels, scroll-triggered animation and a multi-field form. Each was implemented declaratively in CSS. The general principle is that **a hidden form control holds the state**, a `<label>` acts as the button that changes it, and CSS sibling selectors respond to the change.

6.2 Carousel

Six radio inputs share a name, so only one can be checked. Each label is bound to a radio by `for`. When a radio is checked, the general sibling combinator `~` targets the track and translates it horizontally. Previous and next arrows are duplicated for each position and shown or hidden by the same mechanism, so they always point to the correct neighbouring slide.

```
/* one property changes; the carousel moves */
#s2:checked ~ .slider__viewport .slider__track {
  transform: translateX(-16.6667%);
}
#s2:checked ~ .slider__dots .dot:nth-child(2) {
  background: var(--foil);
  width: 50px;
}
```

6.3 Tabbed panels

The payment page presents five methods, each with different instructions. All five panels exist in the markup; only the one matching the checked radio receives `display: block`. The same selector highlights the active tab, so the two never disagree.

6.4 Scroll-driven animation

Content fades and rises as it enters the viewport, with grid items staggered so cards arrive in sequence rather than simultaneously. This uses `animation-timeline: view()`, which drives animation progress from scroll position rather than elapsed time.

```
.card {
  animation: revealUp linear both;
  animation-timeline: view();
  animation-range: entry 4% cover 26%;
}
/* later grid children start slightly later */
.cards > .card:nth-child(3n+2) { animation-range: entry 9% cover 33%; }
```

Because the technique sets elements to zero opacity initially, an unsupporting browser would leave content permanently invisible. The entire block is therefore wrapped in `@supports (animation-timeline: view())`, so browsers without support never receive the hidden starting state. It is additionally wrapped in `@media (prefers-reduced-motion: no-preference)` so that users who have requested reduced motion are excluded entirely.

6.5 Form implementation

The booking form uses native HTML validation — `required`, `type="email"` and `type="date"` — which the browser enforces without scripting. Two submit buttons use the `formaction` attribute to route to different email addresses, separating UGC enquiries from all other work. This is standard HTML5 and needs no script.

6.6 Print stylesheet

The three business documents are designed to be printed or saved as PDF. A dedicated `@media print` block hides site navigation, footer and interactive elements, then applies page-break rules so that clauses and signature blocks are never split across pages.

A subtle but important detail: browsers discard background colours when printing by default, as an ink-saving measure. The property `print-color-adjust: exact` overrides this, preserving the brand identity in the printed document.

```
@media print {  
  *, *::before, *::after {  
    -webkit-print-color-adjust: exact !important;  
    print-color-adjust: exact !important;  
  }  
  .clause, .sign { break-inside: avoid; }  
}
```

7 Bilingual architecture

Two approaches were considered. The first was a CSS toggle holding both languages in one document and hiding one. This was rejected: without scripting, the choice cannot persist across navigation, so a Malay-speaking visitor would be returned to English on every page change.

The approach adopted instead gives each page a fully translated counterpart, with the switcher linking to the *corresponding* page rather than to the home page. Language therefore persists throughout the visit, and either version can be shared directly by URL. Each document declares its language in the `<html lang>` attribute so assistive technology pronounces content correctly.

Translation was complete rather than partial — forms, terms, contract clauses and payment instructions are all rendered in Malay. Industry vocabulary that Malaysian creators use in English (*UGC, KOL, KOC, hook, deliverable*) was deliberately retained, as translating it would read less naturally to the intended audience than leaving it.

8 Accessibility

Accessibility was treated as a functional requirement rather than an afterthought, on the reasoning that a visitor who cannot read the form cannot make a booking.

AREA	MEASURE	RESULT
Text contrast	Form fields and dropdown options	19.3:1 (WCAG AAA requires 7:1)
Label contrast	Field labels against card background	7.6:1 (passes AAA)
Keyboard	3px focus ring with offset on all controls	Fully keyboard navigable
Motion	<code>prefers-reduced-motion</code> honoured	All animation disabled on request
Semantics	Landmark elements, alt text, label association	Screen-reader compatible
Target size	Checkboxes enlarged to 24px	Easier for motor impairment

A problem discovered in testing. The booking form originally sat on a deep-coloured band. Native dropdown lists are rendered by the operating system and do not inherit page styling, which produced dark text on a dark list — effectively unreadable. Rather than fight the browser, the form was restructured to sit on its own light card, guaranteeing dark text on white for every option regardless of surrounding design.

The most demanding part of the project was not technical. It was converting an informally run freelance practice into a set of rules a stranger could read once and understand.

9.1 Services

Twelve services are presented, with four UGC specialisms distinguished separately: standard UGC Creator work, Canvas UGC (building and running a new social account for a brand for thirty days), Tech UGC and Mom UGC.

9.2 Billing patterns

Different services carry different risk profiles, so a single payment rule would be either unfair to the client or unsafe for the creator. Four patterns were defined and mapped to service type:

PATTERN	APPLIES TO	REASONING
Pay before each step	Single video, video editing, photo editing	Small discrete jobs; nothing is produced on credit
Paid in full, 28th–31st	Bundles, Canvas UGC, ambassadorship, retainers, reviews	Ongoing work closes each month before the next begins
50% deposit + 50%	Voice-over, voice artist, voice talent	Fast turnaround; a voice-tagged draft allows approval before release
Day rate, invoiced after	Photography, commercial talent, short acting, canvas makeup	Whole-day commitments are billed by day, not by piece

9.3 Pricing structure

Pricing is expressed as a base figure plus transparent percentage add-ons: raw unedited footage (+50%), rush turnaround (+30–60%), posting on the creator's own channels (+10% paid in advance), building and handing over a new account (+15%), in-person attendance in Peninsular Malaysia (+50–80%), a further +10% for Sabah, and +10–15% for last-minute on-site bookings. A worked example shows how these stack.

9.4 Protective terms

Three mechanisms protect both parties. Work is first delivered **watermarked**, so the client can review the full piece before paying the balance while the creator retains leverage. **Usage rights** are tiered, so organic posting is free but paid advertising is priced by term and territory. **Cancellation terms work in both directions** — the deposit is retained if the client withdraws, but a full refund including the deposit is given if the creator cannot deliver.

Design insight. Terms written only to protect one side read as defensive and make cautious clients hesitate. Stating clearly what happens when the creator is at fault makes the non-refundable clause easier to accept, at no practical cost.

Three documents extend the site beyond presentation into transaction.

- ✦ **Booking Agreement** — thirteen clauses in plain language covering scope, price and add-ons, payment schedule, timeline, delivery, usage rights, revisions, in-person attendance, cancellation, late payment, confidentiality, liability limits and governing law, followed by signature blocks for both parties plus optional witness and company stamp.
- ✦ **Invoice** — branded letterhead, invoice numbering, from and bill-to blocks, a five-row line-item table, totals with a highlighted amount due, an add-on checklist, and payment instructions with the DuitNow QR code embedded directly in the file.
- ✦ **Receipt** — payment confirmation with a stamp, method and reference, running balance, and a checklist of what happens next in the project.

Each document is also produced as a **self-contained file** with the stylesheet and QR image embedded as data, so it can be emailed or opened offline with nothing attached.

Testing focused on failures that are invisible to casual inspection.

TEST	METHOD	OUTCOME
Link integrity	Automated crawl of every <code>href</code> and <code>src</code> across 18 pages, plus anchor-target matching	0 broken links or anchors
Animation safety	Programmatic scroll through each page recording peak opacity of all 163 animated elements	1 element found stuck at 68%; fixed and re-verified
Contrast	Computed colour values extracted and contrast ratios calculated	19.3:1 and 7.6:1 — both exceed AAA
Carousel logic	Track offset and active indicator measured at each of six positions	Correct at all positions
Media loading	Audio duration read from the loaded element	All 22 tracks load and play
Colour accuracy	Stylesheet scanned for unintended 8-digit hex values	1 transparency bug found and corrected
No-JavaScript compliance	Search for <code><script></code> , <code>javascript:</code> and inline handlers	0 occurrences across all files
PDF output	PDF content streams inspected for non-greyscale colour operators	Brand colours confirmed present

12.1 Content left invisible by animation

Scroll-driven animations begin at zero opacity. If an element never completes its animation range, it stays invisible permanently — a silent failure that a quick visual check would miss. A scripted test scrolled each page in small increments and recorded the peak opacity of every animated element. Of 163 elements, one was found reaching only 68%: a block inside the hero that is already on screen at load and therefore never traverses its entry range. The fix was to exclude above-the-fold content from scroll-driven reveals.

12.2 An accidentally transparent colour

The deep sections appeared washed out. The cause was a mistyped eight-digit hexadecimal value, `#34112449`, in which the final two characters set 28% opacity. The page beneath showed through. Detected by inspecting the computed background rather than by eye, and corrected to `#341124`.

12.3 Operating-system controls ignoring page styling

Dropdown option lists are drawn by the operating system, not the page, so they do not inherit the site's colours. Placing the form on a dark background therefore produced unreadable menus. Resolved architecturally by giving the form its own light card.

12.4 Print output discarding the design

Saving a document as PDF initially produced plain black-and-white output. Two causes: browsers strip backgrounds when printing by default, and the print stylesheet had been written to force monochrome for ink economy. Both were corrected — `print-color-adjust: exact` was added and the monochrome override removed — after determining that a client-facing invoice should carry the brand rather than save ink.

12.5 Language persistence without scripting

A CSS-only toggle cannot remember a choice across page loads. Solved by architecture rather than code: mirrored pages with counterpart-aware links.

12.6 Balancing decorative and commercial goals

The visual brief and the business purpose conflicted at several points. The resolution adopted throughout was that **where decoration and clarity compete, clarity wins** — most visibly in the booking form, which was deliberately made plainer than the surrounding design.

The project has genuine constraints, stated plainly:

- ✦ **Form submission.** Without scripting or a server, the booking form opens the visitor's email client rather than posting to an inbox. Some browsers block this. A WhatsApp route with a pre-filled checklist is provided as a fallback, but this is the weakest point of the build.
- ✦ **Unpopulated media.** Twenty video and twelve photography slots are prepared and styled but not yet filled, since the media files were not available during development.
- ✦ **Browser support for scroll animation.** `animation-timeline` is supported in Chromium browsers but not yet universally. The feature degrades safely, but is not seen by every visitor.
- ✦ **Duplicate maintenance.** Two language versions must be updated in parallel; an edit in one is not reflected in the other.
- ✦ **No content management.** Updating text requires editing HTML directly.

1. A form-handling service so submissions arrive reliably without scripting on the page.
2. A booking calendar reflecting genuine availability.
3. Sequential invoice numbering with a record of issued documents.
4. A content management layer allowing text edits without touching code.
5. Analytics to identify which services generate enquiries.
6. A shared template system to remove duplicate maintenance between languages.

The project delivers a working bilingual portfolio and booking platform built entirely in HTML and CSS. It presents work across three media types, states commercial terms in enough detail to prevent disputes, captures a complete brief in a single submission, and produces the contract, invoice and receipt needed to complete a transaction.

The constraint that initially appeared limiting — no JavaScript — proved instructive. Features normally reached for reflexively with a script were achievable declaratively, and the resulting site is faster, more robust and more accessible than a scripted equivalent would have been. There is no code that can throw an error at runtime.

The more significant lesson concerned priorities. The most attractive version of the booking form was, on measurement, unusable. Deciding that clarity should outrank decoration wherever the two conflict shaped the final build more than any technical choice, and reflects the underlying purpose: a portfolio that looks beautiful but loses a booking has not succeeded.

A Appendix — File inventory

GROUP	FILES	COUNT
English pages	index, voice, work, book, contact, payment, contract, invoice, receipt	9
Bahasa Melayu pages	as above, suffixed <code>-bm</code>	9
Stylesheet	<code>style.css</code> — 1,925 lines	1
Audio	Voice demo tracks (.m4a)	22
Standalone documents	Self-contained HTML and PDF versions	12
